# API Endpoints

The Foursquare API provides methods for accessing a **resource** such as a venue, tip, or user. In spirit with the RESTful model, each resource is associated with a URL. For example, information about [Clinton Street Baking Co](#) can be found at

```
https://api.foursquare.com/v2/venues/40a55d80f964a52020f31ee3
```

(you need to supply your own [credentials](#) and [version](#) as extra parameters)

Given a resource, you can then drill into a particular **aspect**, for example

```
https://api.foursquare.com/v2/venues/40a55d80f964a52020f31ee3/tips
```

Each returned tip will have its own ID, which corresponds to its own resource URL, for example

```
https://api.foursquare.com/v2/tips/49f083e770c603bbe81f8eb4
```
